

Semester Project

Below is a breakdown of the various milestones included in your semester project. The percentage in front of each one shows the percent of your semester project grade that part will be worth.

Your project needs to incorporate all the main aspects of this course. Here are the deliverables:

1. (10%) A report on the data you will use for this project. These should be “real data” that could be used for serious analysis. They should not be example datasets for R, textbooks, etc. The report needs to include things like:
 - i. What the data are.
 - ii. The source of the data (e.g. a public repository, public records, research project, etc.).
 - iii. What variables are included in the data, and what type of variables they are (i.e. numeric, categorical, dates, etc.).
 - iv. A breakdown of missing values in the data.
 - v. A proposed title for your project.
2. (20%) A report on pre-processing that you performed on the data and exploratory data analysis. The data should need to be cleaned or processed in some way (talk to me if you have any doubts). You should demonstrate that you examined the variables, looked for outliers, identified potentially interesting relationships, etc.
3. (50%) A report that includes either a single visualization, or a set of visualizations that demonstrate the story that you want to tell in combination with the included text. The visualization needs to include an interactive element, and multiple types of data (numeric, categorical, etc.).
4. (20%) A video presentation of you explaining the project and some interesting insights that can be gained from it. You don't need to show yourself in the video unless you want to. Pretend you are giving a presentation for a specific purpose (business, academic, etc.) and that you are speaking to an audience.
